

TRENCHLESS SECTIONAL REPAIR SYSTEM FOR PIPES 3 – 72 INCHES

POINT REPAIR SOLUTIONS

»»» EASY TO USE

Simple installation process is fast and easy to learn

»»» SAVE TIME & MONEY

Premeasured mix and pre-cut components means no wasted materials or labor

»»» INSTALL DURING ACTIVE INFILTRATION

Installation can be completed in wet conditions, even with active infiltration

»»» LONGEST WORKING & QUICK CURE TIMES

Provides the longest working window of any silicate-based resin repair system

»»» COMPLETE SOLUTION

Pre-packaged solutions come with everything needed for a complete repair

»»» AVAILABLE ANYTIME, ANYWHERE

Purchase online with upfront pricing whenever its convenient for you

EASILY EXTEND THE LIFE OF DAMAGED PIPES.

Point Repair is the ideal solution to structurally repair sections of otherwise healthy pipe without digging it up. HammerHead Trenchless offers sectional point repair solutions for pipe from 3 to 72 inches in diameter. The system is compatible with a wide range of host pipe materials including concrete, reinforced concrete, vitrified clay, PVC, corrugated metal and asbestos cement. Our point repair system consists of a specially designed glass-reinforced fabric and 2-part ambient-cure silicate resin. Each point repair comes as a pre-packaged solution for a specified size saving you the hassle and waste of cutting, measuring and mixing on site. Once cured, it exceeds the structural requirements of ASTM F1216 and ASTM F3541-22 for all sewer and storm water pipes having a circular or oval cross section and it has up to a 50-year service life. Point repair is the most cost-effective way to trenchlessly repair sections of pipe.

MEETS E80 AND H20 LOAD RATING STANDARDS

Point repair solutions from HammerHead Trenchless are the only systems designed to meet E80 and H20 load ratings for use beneath railways and highways.

VERSATILE SOLUTION. Point repair is an appropriate solution for a wide variety of issues seen in different types of pipes. It can be used in conjunction with CIPP installations or as stand-alone application over offset joints, pipe separations and damaged siphons. It can also be used to seal off interior drops and cap off unwanted laterals. It can even replace missing sections of pipe, repair 90° bends, bridge transitions or add extensions to a culvert.

CONVENIENT AND EFFICIENT. Point repair from HammerHead Trenchless is designed to be easy: easy to learn, easy to prepare & install, and easy to clean up. The simple installation process allows crews to quickly become confident and efficient. Plus, HammerHead offers on-the-job training to help ensure your crew's success on every repair. Convenient packaging makes preparation and clean up hassle-free. While other point repair systems require you to apply messy resin with your hands, HammerHead point repair solutions are assembled to minimize time wasted on clean up. Resin is mixed in its purpose-made packaging, then spread with a spatula to saturate the mat. Each solution comes with a plastic working surface and gloves so clean up is as easy as folding up the plastic and throwing it in the trash.

LONGEST WORKING TIME, QUICK CURING TIME. The working time of HammerHead point repair systems is the longest of any silicate based resin offered by similar systems on the market. Choose between "winter" and "summer" and "winter-express" point repair solutions to match working time to your job conditions.

NON HAZARDOUS, LONG SHELF LIFE. HammerHead point repair resin is odor-free, styrene-free and VOC-free. It presents no hazards to the environment or to human health. It keeps well in the container without the risk of leakage. Its long shelf life means you can keep inventory on site.

Each point repair solution is custom-assembled to your project requirements and includes fiberglass mat, pre-measured resin and hardener, packer protection sleeves, spreading spatula, work surface, electricians' tape, disposable gloves and ties. Materials are precisely cut, measured and weighed to eliminate waste and help ensure successful installations, every time.
